LDAP	authentication	profile	examples
------	----------------	---------	----------

•	Active Directory common settings: with Administrator bind, group membership tends to incl	ude full user DN.
•	 Active Directory common settings: with Anonymous bind. If LDAP/AD user can bind with the and password, it validates the user login 	e DN jdoe@example.com
•	OpenLDAP settings: with Administrator bind.	
•	 OpenLDAP settings: with Anonymous bind, If LDAP user can bind with the DN "cn=jdoe, ou=dc=com" and password, it validates the user login 	People, dc=example,
•	 Secure vs Non-Secure LDAP settings: typically LDAP uses port 389 for clear text, port 636 f possible LDAPS is preferable. Just port alone does not determine LDAP security mode, hence explicitly check the box to indicate whether secure LDAP is in use or not. 	

	up Filter, (objec ched for membe		l .

• Group Filter, (objectClass=posixGroup): openLDAP groups can in some environments be of type "posixGroup" instead

of just "group".

•	Group Filter, more complex options: (&(objectCategory=group)(cn=Avi-*the name "Avi-"; the search can avoid fetching other groups. Some organi hierarchy and its preferable to filter them based on known scenarios.	
•	Group member is full DN or not? Auth Profile test page can print the full entries the member attribute value shows whether it is full DN or not.	DN tree from base DN level. For group

• Ignore referrals: this is a useful option if LDAP group search is delayed due to unnecessary referral searches. When

enabled, the group search will skip referrals links that connect to another LDAP server.
